

Throws (Puckling Exception)

4-w figure out → All checked Exception

Notes

1. throws keyword is used to "check" an exception
2. throws keyword will not handle the exception rather it checks (propagates) the exception to the caller method
3. throws keyword is used for checked Exception, so that we can compile the code successfully
4. throws will not lead to normal termination, it just helps for compiling the code successfully
5. throws is written after method parameter list

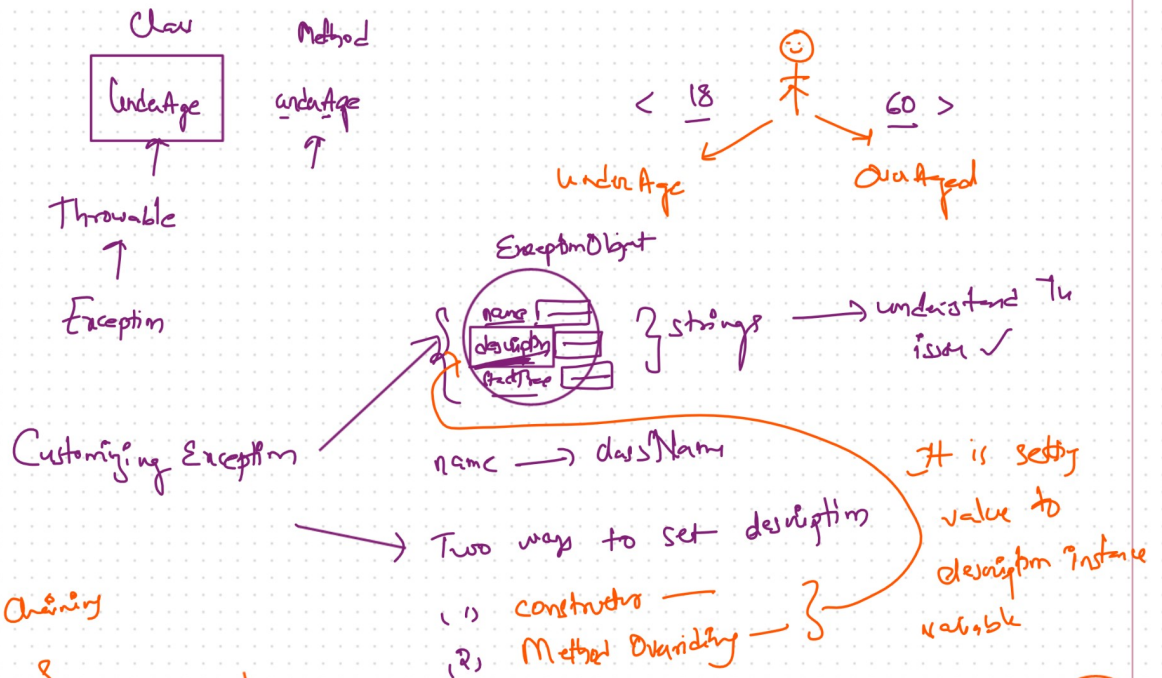

public static int add() throws Exception class {

5

Customized Exception [partially checked]

→ We can create our custom exceptions by extending "Exception class"

2 - scenarios

Constructor Chaining

class Parent {

int n;

Parent (int input) {

→ this.n = input

3

class Child extends Parent

Child (int input) {

super(input)

3

new Child (2)

n [2]

② → e.toString() → Exception → Throwable

toString() {
return getMessage();

}
